

Advanced Computer Architecture

Evaluating Systems

Fall 2016

Pejman Lotfi-Kamran

Adapted from slides originally developed by Profs. Hill, Hoe, Falsafi and Wenisch of CMU, EPFL, Michigan, Wisconsin

Fall 2016

Lec.12 - Slide 1

Where Are We?

● Evaluation

◆ Next Lecture:
● Coherence

Fall 2016

Lec.12 - Slide 2

Commercial Server Software

Fall 2016

Lec.12 - Slide 3

Commercial Server Software

- ◆ Primary market for multiprocessor systems
- ◆ Examples:
 - Database systems: Oracle, DB2, SQLServer, PostGres, MySQL
 - Business apps: SAP, BAAN, PeopleSoft
 - Data analysis: MapReduce, large scale graph processing
 - Web-servers
 - ▲ Static content
 - ▲ Dynamic content: database integration + business logic
 - ▲ Web 2.0: user-supplied content
 - Infrastructure apps: memcached, J2EE

Fall 2016

Lec.12 - Slide 4

Why study database apps?

- ◆ They are economically important
- ◆ They share characteristics of many other apps (filesystems, web search, etc.)
- ◆ The vendors have spent a lot of time optimizing (generally, they won't have silly bottlenecks)

Fall 2016

Lec.12 - Slide 5

Key characteristics

- ◆ Large, complex, monolithic software systems
- ◆ Designed for MP systems
 - Clusters (distributed databases)
 - Shared Memory
- ◆ Subsumes many OS functions
 - File system
 - Scheduling and multi-threading
 - Memory management
- ◆ Designed for high reliability (ACID properties)
 - Atomicity: a transaction happens or doesn't
 - Consistency: the state of the DB remains consistent
 - Isolation: transactions are independent
 - Durability: once performed, transactions are permanent

Fall 2016

Lec.12 - Slide 6

How are they different from Sci Apps?

- ◆ Requires tuning: knowledge-intensive, difficult
- ◆ Competitive market:
 - deliberate obfuscation/ benchmark gaming
- ◆ Large instruction footprints (I\$ matters)
- ◆ Huge data footprints (TLBs matter)
- ◆ Weird access types (non-cacheable, etc.)
- ◆ Latency, not bandwidth bound
- ◆ Dynamic memory allocation, garbage collection
- ◆ More pointer-chasing, fewer arrays
- ◆ No single obvious "working set"
 - multiple working sets with varying temporal locality
- ◆ Unpredictable sharing patterns
- ◆ Data & lock contention

Fall 2016

Lec.12 - Slide 7

Standardized Benchmarks

Transaction Processing Council (TPC)

- Strict scaling, disclosure, auditing rules
- Running these for real is hard: big hardware, 20-50 engineers, months of effort
- Running them in simulations is also hard: scaling, non-determinism

Two flavors of benchmark

- Online transaction processing (OLTP): TPC-C
 - Lots of small transactions
 - Lots of locking, concurrency, I/O; memory-latency bound
- Decision support system (DSS): TPC-H
 - Large, complex read-only queries
 - Often compute bound (given enough disks)
 - Highly parallel, data partitioning, parallel operators

Fall 2016

Lec.12 - Slide 8

DSS – Impact of ILP

- ◆ Lots of ILP
- ◆ Multiple issue helps, but OoO helps more
- ◆ L2 hits account for most data stalls

Fall 2016

Lec.12 - Slide 9

OLTP – Impact of ILP

- ◆ Instruction cache misses & synch are now issues
- ◆ Less ILP, but 2-way still helps a lot
- ◆ Coherence (dirty) & DTLB misses most read stalls

Fall 2016

Lec.12 - Slide 10

Emerging Scale-Out Workloads (Ferdman et al., ASPLOS 2012)

Fall 2016

Lec.12 - Slide 11

Scale-Out Datacenters

Massive Scale

- \$100+ M investment
- 5-20 MW power budget

Why?

- Massive data sets, complex queries
- Global demand

Applications

- Web search, media streaming, social connectivity
- Scale-out by design

Fall 2016

Lec.12 - Slide 12

Characteristics of Scale-Out Apps

- ◆ Many independent requests/tasks
- ◆ Huge dataset split into shards
- ◆ Minimal communication among servers

Fall 2016

Lec.12 - Slide 13

How Efficient are Today's Servers?

- ◆ Created benchmark suite
 - Diverse set of cloud workloads
 - Quantified high-level behavior
- ◆ Studied off-the-shelf hardware
 - Used performance counters
 - Identified needs of cloud apps

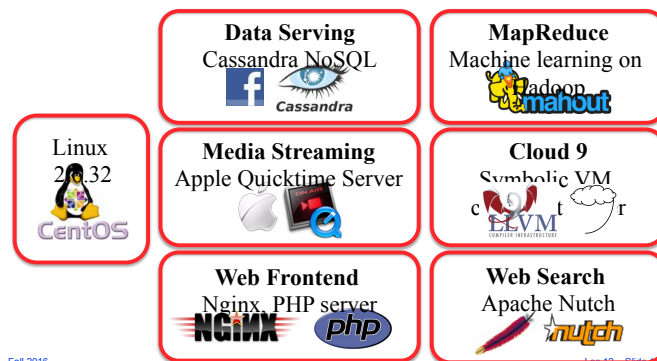

Modern CPUs don't match needs of cloud apps

F

Cloud Suite 1.0

(released @ parsa.epfl.ch/cloudsuite, tutorial @ ISCA 2012)

Fall 2016

Lec.12 - Slide 14

Hardware

Dell PowerEdge
M1000e

Dell Blades
M610

Two Intel x5670
2.9GHz
6-core, 12MB LLC

24GB RAM

Fall 2016

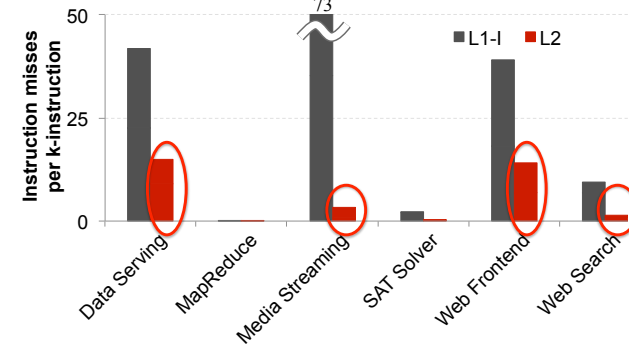

Lec.12 - Slide 16

Core Inefficiencies

Execute ~1 instruction per cycle

Instruction-Fetch Misses

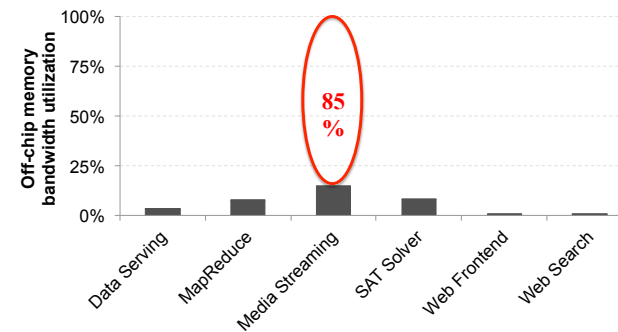

Suffer severe i-cache miss penalties

LLC Sensitivity

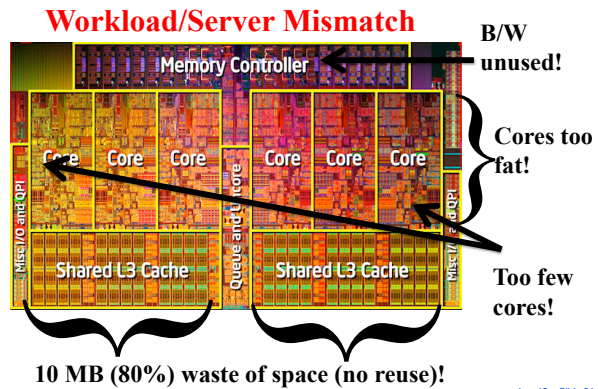

Minimal performance from large LLC

Off-chip Memory Bandwidth

Off-chip BW severely underutilized

Clearing the Clouds in a nutshell [ASPLOS 2012]

Summary

- ◆ Accurate metrics to evaluate designs
- ◆ Don't forget the laws!
- ◆ Tools
- ◆ Wide spectrum of parallel workloads
